EXPERIENCE

From the Ground Up Tour · I wear all hats

since Mar 2026

Rapper: Presented 20 concerts (and counting) across the US and Canada for hundreds of people of all ages

Booking agent: Built outreach pipeline that sourced hundreds of prospective hosts by email and phone, advancing each through contact-to-booking state machine

Promoter: Launched press kit sponsor form that turns host confirmation into city poster, RSVP link, and Eventbrite listing

Fundraiser: Brought in over $8K, mostly post-concert honoraria plus merch sales and donations, while hosts covered flights, car rentals, lodging, and venue space

Accountant: Wired Claude into tour finances through MCP server, pulling bank activity from signed-in browser session and comparing against ledger to catch unrecorded expenses and revenue

Content creator: Published dozens of videos on Instagram, editing in DaVinci Resolve and force-aligning captions with OpenAI Whisper

Lyrist · Founder

since Feb 2023

- Developed toolkit for songwriters to discover "artist type beats", capture song ideas, and overcome writer's block, earning over $10K in premium subscription revenue
- Built scraper that mined YouTube for independent artists, extracting thousands of contact emails to automate outreach
- Mentored underserved students in CodeDay's internship program during multiple summers, including 2 engineers and 1 product manager who designed and launched writer's block screen
- Hired 2 content creators who posted 100 TikToks each to promote mobile app
- Started label "Lyrist Records" to independently release original hip-hop music

Microsoft · Software Development Engineer: next page

Aug 2016 to Aug 2026

SKILLS

Languages	TypeScript · JavaScript · C# · Python · Swift · Kotlin
Stack	React · React Native · Next.js · Node.js · .NET · Supabase · Firebase · Playwright · SwiftUI · Logic Pro · DaVinci Resolve
AI	Claude · ChatGPT · Copilot · Gemini · OpenAI Whisper

EDUCATION

B.S. Computer Science, University of Florida

A DECADE AT MICROSOFT

Azure Incident Management UX `2024 to 2026`

- Pioneered AI-assisted engineering for Microsoft's incident management mobile app, building skills library that turns feature description into tested code ready for review in under 30 minutes
- Raised test coverage from single digits to 80% in React Native and 50% in .NET, writing 1 prompt per stack that swept each codebase, tailored to Jest and xUnit
- Found Windows-only dependency blocking Mac development by prompting Copilot through .NET backend, then collaborated with owning team so agents build features from client to service on one machine
- Swapped abandoned third-party auth dependency for Microsoft's own library, rebuilding its iOS and Android modules on React Native's new architecture and closing supply-chain risk, then walking 50+ engineers through migration plan and rationale
- Taught 10 web and mobile engineers auth, design, and notification systems before their first on-call shifts
- Identified 3 services running with no reliability monitoring and defined 99.9% objectives for each, eliminating blind spots in telemetry

Office Scripts Services `2020 to 2024`

- Architected Excel Triggers, designing subscription and webhook APIs across 3 services so Power Automate flows could fire on spreadsheet changes, shipped to internal stakeholders
- Migrated live permission records for automations off deprecated middleware to direct store access, reaching 100% of production without incident
- Diagnosed high-volume disposal failures in storage service, proving shared HttpClient was root cause, escalating to .NET experts and completing first fixes toward 99.9% reliability before handoff

Office Scripts in Excel `2019 to 2020`

- Wrote TypeScript client library and REST APIs to save, load, version, and share Excel automations, with 100% unit-test coverage
- Added integration tests and release gates blocking on test failures and coverage thresholds, protecting every release through general availability, where Office Scripts reached close to 1M monthly customers as modern alternative to macros

Outlook Extensibility `2016 to 2019`

- Wrote JavaScript program that tested every API available to Outlook web apps called "add-ins" on desktop, web, and mobile, so engineers caught inconsistent behavior before release and support teams diagnosed failures faster
- Built React-based JavaScript APIs for Mail and Calendar add-ins in Outlook web, used by millions of customers and developers
