EXPERIENCE

From the Ground Up Tour · I wear all the hats

since Mar 2026

Rapper: Presented 16 concerts (and counting) across North America for hundreds of people of all ages

Booking agent: Wrote outreach pipeline that sourced and tracked hundreds of prospective hosts through contact-to-booking state machine, filling the calendar by email and phone

Promoter: Launched press kit sponsor form that turns a host’s yes into rendered poster, RSVP link, and Eventbrite listing

Fundraiser: Brought in over \$6K, mostly post-concert honoraria plus merch sales and donations, while hosts covered flights, car rentals, lodging, and venue space

Accountant: Wrote MCP server that lets Claude query tour finances, pulling bank activity from signed-in browser session and comparing against ledger to reconcile anything unrecorded

Content creator: Published dozens of videos for my 1.8K supporters on Instagram after editing with DaVinci Resolve and force-aligning captions word for word with OpenAI Whisper

- Lyrist · Founder

since Feb 2023
- Developed toolkit for songwriters to discover “artist type beats”, capture song ideas, and overcome writer’s block, earning over \$10K in premium subscription revenue
 - Built scraper that mined YouTube for independent artists, extracting thousands of contact emails to automate outreach
 - Mentored underserved students through CodeDay across multiple summers, including 2 engineering interns and 1 product manager intern who designed and launched writer’s block screen
 - Hired 2 content creators who posted 100 TikToks each to market the app
 - Started label “Lyrist Records” to independently release original hip-hop music

Microsoft · Software Development Engineer: next page

since Aug 2016

SKILLS

Languages	TypeScript · JavaScript · C# · Python · Swift · Kotlin
Stack	React · React Native · Next.js · Node.js · .NET · Supabase · Firebase · Playwright · SwiftUI · Logic Pro · DaVinci Resolve
AI	Claude · ChatGPT · Copilot · Gemini · OpenAI Whisper

EDUCATION

Azure Incident Management UX since 2024

- Pioneered AI-assisted engineering for Microsoft's incident management mobile app, building library of AI skills that goes from feature description to tested code and prepared pull request in under 30 minutes
- Found Windows-only dependency blocking Mac development by prompting through our .NET backend, then collaborated with owning team to get agents working across both codebases at once
- Raised test coverage from single digits to 50% across .NET services and 80% in the mobile app, writing 1 prompt per stack that swept each codebase, tailored to xUnit and Jest
- Swapped abandoned third-party mobile app dependency for Microsoft's authentication library, rebuilding its iOS and Android modules on React Native's new architecture and closing a supply-chain risk, then walking more than 50 people in the org through the cutover and rationale
- Caught 3 services running with no reliability monitoring and defined 99.9% objectives for each
- Taught 10 web and mobile engineers our app and its .NET services in 4 sessions, part of org push to break platform silos

Office Scripts Services 2020 to 2024

- Architected Excel Triggers end to end, designing subscription and webhook APIs across 3 services so Power Automate flows could start the moment a spreadsheet changed, shipping to private preview
- Migrated live permission records for automations off deprecated middleware to direct store access, reaching 100% of production without incident
- Diagnosed high-volume disposal failures in storage service, proving shared HttpClient was root cause against internal skepticism, escalating to Microsoft .NET experts and shipping first fixes toward 99.9% reliability

Office Scripts in Excel 2019 to 2020

- Wrote TypeScript client library and REST APIs to save, load, version, and share Excel automations, at 100% unit-test coverage
- Added integration tests and release gates blocking on test failures and coverage thresholds, protecting every release through general availability, where Office Scripts reached close to 1M monthly customers as a modern alternative to macros

Outlook Extensibility 2016 to 2019

- Wrote JavaScript add-in that exercised every API available to Outlook add-ins across desktop, web, and mobile, so engineers caught inconsistent behavior before release and support teams diagnosed failures faster
- Built React JavaScript APIs that let mail and calendar add-ins run in the new Outlook web client, helping launch without breaking add-ins for millions of customers and developers
